

Incident report analysis

Instructions

As you continue through this course, you may use this template to record your findings after completing an activity or to take notes on what you've learned about a specific tool or concept. You can also use this chart as a way to practice applying the NIST framework to different situations you encounter.

Summary	A company experienced a DoS attack which took down their internal network for two hours and no network resources could be accessed internally because of the incoming flood of ICMP packets. The incident team blocked the incoming packets then took all non critical network services offline and they then restored the network services. It was later found out a threat actor flooded the company's network through an unconfigured firewall which allowed the DoS attack.
Identify	Network's services stopped responding and internal traffic couldn't access any network resources for two hours due to a DoS attack caused by a flood of ICMP packets sent through a firewall that wasn't configured
Protect	Source IP verification added to firewall to check for spoofed IP addresses. A new firewall rule was added
Detect	An IDS/IPS system has been put in place to filter out the ICMP traffic. Network monitoring software was installed to detect abnormal network traffic in real time
Respond	The incoming ICMP packets were blocked and all non critical network were taken offline. Critical network services were restored

Recover	Non critical services were brought back online after the threat was contained and the firewall was configured properly
